

How To Use analyze_database_trades_v4.py

Explained Step by Step (Like Teaching a Child)

■ What Is This Script For?

This script is like a detective for your trading database. It looks inside a file full of trades and finds patterns that show what big players (institutions) are doing. It helps you understand where smart money is moving and when.

■ What You Need Before Running:

1. Python 3 (download from python.org)
2. Pip (comes with Python)
3. Install required libraries:
`pip install sqlite3 pandas numpy matplotlib`
4. A database file (example: F:/TradingAgent/institutional_trades.db)

■ Paths You May Need to Change:

Inside the script, find the DB_PATH line:

```
DB_PATH = r'F:/TradingAgent/institutional_trades.db'
```

Change this to your own file location if your database is elsewhere.

■ How To Run It:

1. Open Command Prompt or Terminal
2. Move to the folder with the script: `cd F:/Bookmap/Python`
3. Run: `python analyze_database_trades_v4.py`

■ What You'll See:

- The script connects to your database
- Reports on institutional moves
- Saves alerts (JSON or CSV)
- Can create graphs of volume and trades

■ Common Errors and Fixes:

Error: No such file → Fix the DB_PATH in the script.

Error: No such column: timestamp → Your database needs a schema update.

Error: Module not found → Run pip install for the missing library.

■ Simple Analogy:

Think of the database as a school library. Every book is a trade.

This script is the librarian detective who checks which books (trades) were most popular and when, so you know what the smart kids (institutions) are up to!
